Hello, Ana

Session 5 of 5

We analysed the way you walk on video. This summary explains the main points in plain words.

THE MAIN RESULT

Walking speed

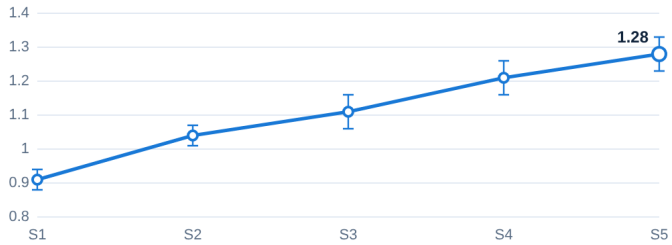
1.28 m/s

Within the usual range

One of the best indicators of health and independence, which is why it is called the "sixth vital sign".

Usual: from 1.14 m/s

Your progress



Since your first session (31 August 2026) you have gone from 0.91 m/s to 1.28 m/s. This is a real improvement: larger than the measurement error.

Your results, one by one

Steps per minute The rhythm of your steps.	**112 pasos/min**	
Stride length How far you move forward every two steps.	**1.36 m**	
Left knee when stepping How much it bends so the foot clears the ground.	**59°**	
Right knee when stepping How much it bends so the foot clears the ground.	**61°**	
Equal step length The more alike the steps of each leg, the more efficient the walk.	**0 % difference**	
Equal timing between legs If one leg takes longer than the other, it is often protecting itself.	**0 % difference**	

Green: within the usual range for healthy people your age. Amber: somewhat outside; this is what we will work on. Red: well outside; this is the priority. The green band on each scale is the usual range and the dot is your result.

A note from your physiotherapist

All your results are within the usual range. Well done! We will keep measuring to maintain it.
